

Briefing Note for the MF, CMAG, EAG, and Clinical Leads 2024

Inactivation of classification derived “Complication” disorders

Purpose

To ask the Member Forum and the Content Managers Advisory Group for details of their usage of classification-derived disorder concepts of “X [with/without] complication” and “X with [antenatal/postnatal] [complication/problem]”.

Background

The Content and Mapping Team is planning for the inactivation of concepts that reference a disorder with or without “complication” without specifying the nature of the complication. The primitive “Complication (disorder)” grouper was inactivated in 2022 due to a lack of consistency or definition of what would properly be assigned as a subtype. This is because “Complication” has many possible interpretations, including:

- Disorder caused by another disorder.
- Severe form of a disorder with exacerbated clinical signs.
- Disorder co-occurrent with another disorder affecting the management of the latter.
- A clinical state or behavior of a patient making management of a disorder more difficult (e.g. behavioral issues or social determinants).
- In pregnancy, a disorder of the mother affecting the fetus; a disorder of the fetus affecting the health of the mother; or a condition that may result in difficult labor and delivery, etc.

The majority of concepts being considered for inactivation originated from ICD-9, which had a pattern of “X disorder, complicated” and “X-disorder, without mention of complication”. A number of these concepts were incorporated into ICD-10 but were assigned residual class codes (i.e. .8 and .9) that represented “NEC” (not elsewhere classified) and “NOS” (not otherwise specified) terms. As statistical residuals, they were included to capture those disorders with additional features not included in ICD as a specific class.

Within SNOMED CT, these concepts are typically primitive or are defined through the use of a primitive “complication” grouper (e.g. 48422000 |Open wound with complication (disorder)|, 57750009 |Open wound without complication (disorder)|)

In the case of concepts with the pattern “X with [antenatal/postnatal] [complication/problem]”, these are all primitive leaf concepts inherited from ICD-9 or the integration of the UK Read codes into SNOMED CT, but recent data shows them to be of very limited use in primary care. The UK has reviewed the list of proposed inactivations and has given their consent for inactivation.

There are also several concepts of the form “X complication”, which are out of scope for this proposal as they will need additional evaluation before recommending a disposition.

Rationale for inactivation

Because of the often difficult nature of the classification-derived concepts, i.e. vagueness of meaning, inability or difficulty in sufficiently defining them, limited direct clinical utility, and struggle to appropriately assign subtypes, inactivation removes ambiguity and avoids inconsistent use of this content.

Action Plan

1. Generate and distribute a list of concepts proposed for inactivation
 - a. The list is included with this briefing note (Appendix A). An Excel sheet is available upon request.
2. Solicit usage data from the community of practice to determine the impact of inactivation.
3. Without objection from the community, inactivate the concepts with the inactivation reason “Classification derived concept” with replacement by the parent concept.

Email responses by 05/01/2024, to Jim Case, Chief Terminologist at jca@snomed.org
