

Briefing Note for the MF, CMAG, and EAG 26 September 2022

Inactivation of Concepts that Include Delivery Status “X delivered/not delivered”

Purpose

To inform the Member Forum, Content Managers Advisory Group, and Editorial Advisory Group of the intention to inactivate concepts that include within the FSN the delivery status of the mother, “delivered/not delivered”.

Background

There are 250 concepts that state the delivery status of the mother within the FSN:

- 198905007 |Placenta previa with hemorrhage - delivered (disorder)|
- 198906008 |Placenta previa with hemorrhage - not delivered (disorder)|

These concepts are classification derived and are used to record whether the baby was, or was not delivered during that inpatient stay for the care of the mother who has placenta previa with a hemorrhage.

Issues

Conflation of the condition for admission and the delivery status at discharge is clinically unhelpful except as a discharge summary and for billing purposes. Clinical management of the patient requires that each element is recorded separately and actioned as appropriate.

These concepts are derived from ICD-9. Both ICD-10 and ICD-11 have ceased to conflate the condition for admission with the delivery status at discharge and therefore mapping to these classifications will not be affected by the inactivation of this SNOMED CT content.

Next Steps

Existing content will be inactivated as follows:

Inactivation of 198905007 |Placenta previa with hemorrhage - delivered (disorder)|:

Inactivation reason: Classification derived concept

Historical associations:

- PARTIALLY_EQUIVALENT_TO: 198903000 |Hemorrhage due to placenta previa (disorder)|
- PARTIALLY_EQUIVALENT_TO: 289256000 |Mother delivered (finding)|

Both of these concepts **must** be used to replace 198905007 |Placenta previa with hemorrhage - delivered (disorder)|

Inactivation of 198906008 |Placenta previa with hemorrhage - not delivered (disorder)|:

Inactivation reason: Classification derived concept

Historical association:

- REPLACED_BY: 198903000 |Hemorrhage due to placenta previa (disorder)|

Action Required

If there are any concerns relating to the planned inactivations please respond to info@snomed.org by 12 MN UTC Friday 23rd October 2022.

Release of changes planned for November 2022 and will be notified in the accompanying Release Notes.

Approvals	Date	Name
Chief Terminologist	21st September 2022	James T. Case
Director of Content and Mapping	21st September 2022	Monica Harry
