

Outline

- SNOMED CT and Decision Support
- LORENZO
 - Medication Management Functionality
 - Prescribing Decision Support
- Experience to date

SNOMED CT and its Benefits

- Comprehensive clinical terminology
- One of its key stated benefits is to facilitate decision support¹
- However there is very limited published literature about the implementation of decision support based on SNOMED CT

¹http://www.ihtsdo.org/snomed-ct/whysnomedct/benefits/

Prescribing Decision Support Benefits

- Numerous studies have proven the actual and potential benefits of the implementation of computerised prescribing decision support
- One US study showed that serious medication error rate can be reduced by 55-80% through computerisation
- In 2007, the National Patient Safety Agency in England estimated that medication error rates cost GBP774m annually to the NHS
 - Of these, 72% are avoidable through computerised prescribing and use of prescribing decision support

Key Prescribing Decision Support Features

- Drug interaction checking
- Drug allergy checking
- Drug contraindication checking
- Drug duplication checking

LORENZO

- LORENZO is CSC's strategic electronic patient record system
- Multi-professional multi-specialty multi-care setting
- Deployed in UK and the Netherlands to date
- Comprises both administrative and clinical functionality

Key LORENZO Clinical Functionality

- Clinical statements
 - Allergies
 - Problems
 - Procedures
- Medication management
 - Outpatient prescribing
 - Discharge prescribing
 - Inpatient prescribing
 - Electronic medicines administration

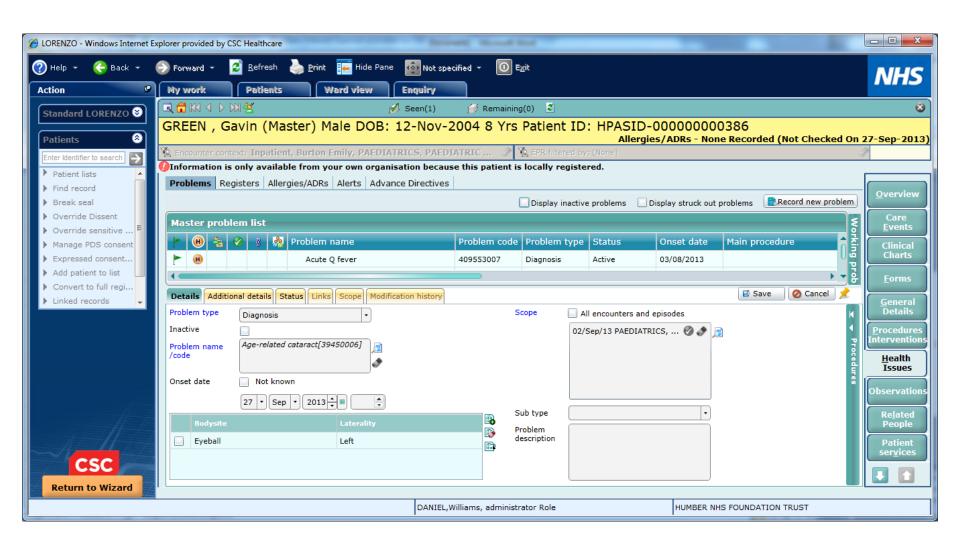

SNOMED CT in LORENZO

- First release of LORENZO targeted for NHS in England
- National Programme for Information Technology (NPfIT) in England stipulated use of SNOMED CT
- Hence SNOMED CT was chosen as clinical terminology for clinical data in LORENZO in NHS England
- SNOMED CT is used to support LORENZO clinical statements like allergies, problems and procedures as well as prescription recording
 - Prescription recording is based on Dictionary of Medicines and Devices (dm+d) which forms part of the SNOMED CT UK Drug Extension

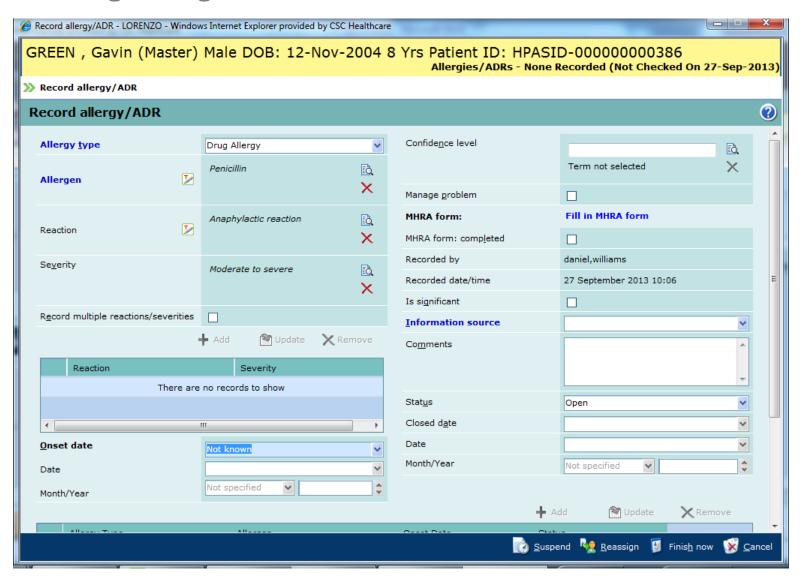

Recording Problems in LORENZO

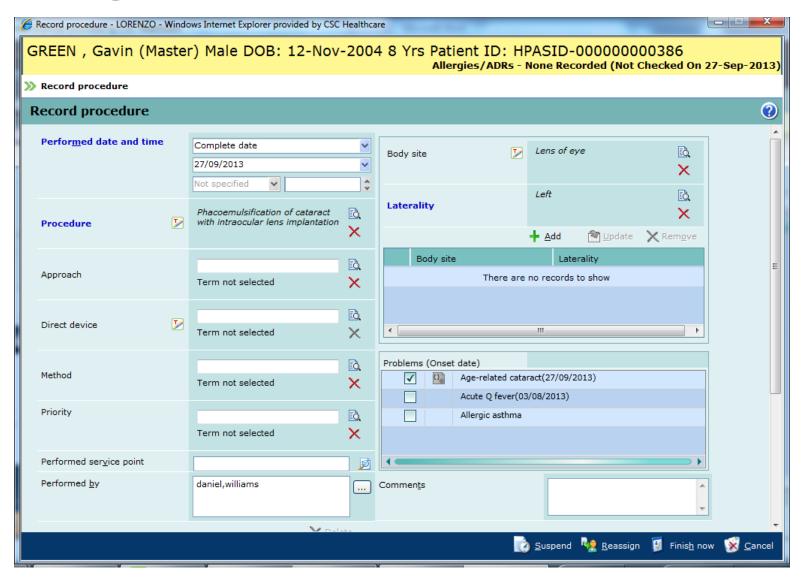

Recording Allergies in LORENZO

Prescribing in LORENZO

LORENZO Prescribing Decision Support

- LORENZO medication management functionality supports the following prescribing decision support features
 - Drug allergy checking
 - Drug contraindication checking
 - Drug interaction checking
 - Drug duplication checking
- SNOMED CT plays a fundamental role in both data recording as well as the knowledge base for most of these features

LORENZO Prescribing Catalogue

- Data on all drugs which can be prescribed through LORENZO
- Knowledge base for prescribing decision support
- Links to drug information monographs
- Support for generic prescribing where appropriate
- Support for prescribing high risk drugs (e.g. methotrexate), controlled drug prescriptions (e.g. morphine), and other flagged drugs
- For NHS, this is sourced from First Databank Europe's Multilex Drug Data File (MDDF) which is mapped to dm+d and includes
 - SNOMED CT-based substance codes for allergy checking
 - SNOMED CT-based conditions for contraindication checking

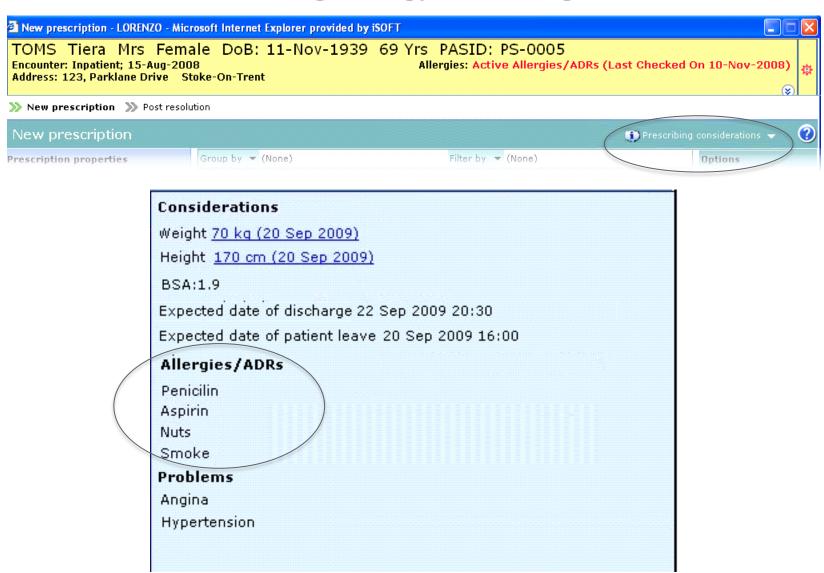

LORENZO Drug Allergy Checking

- This is done in two ways
- Passive allergy checking
 - User can choose to see the list of patient allergies and make appropriate prescribing decisions
- Active allergy checking performed upon selecting drug to prescribe
 - Ingredient an active ingredient of a patient allergen and active ingredient (including the base ingredient) of the drug being prescribed are the same
 - Cross reactor group an active ingredient of a patient allergen and active ingredient (including the base ingredient) of the drug being prescribed belong to the same cross reactor group
 - Ingredient class group an active ingredient of a patient allergen and active ingredient (including the base ingredient) of the drug being prescribed belong to the same ingredient class group

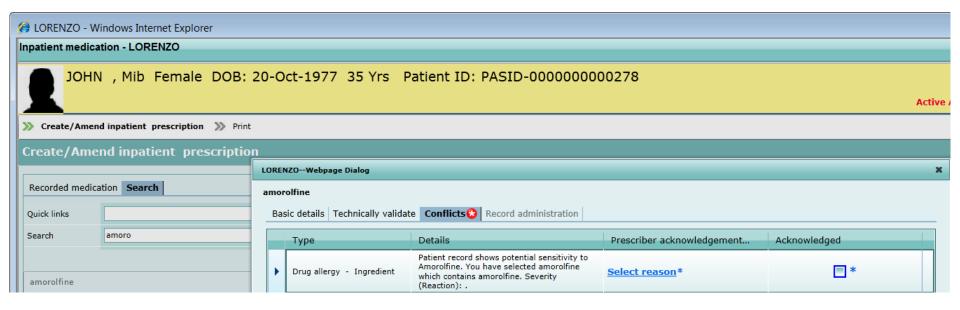

LORENZO Passive Drug Allergy Checking

LORENZO Active Drug Allergy Checking

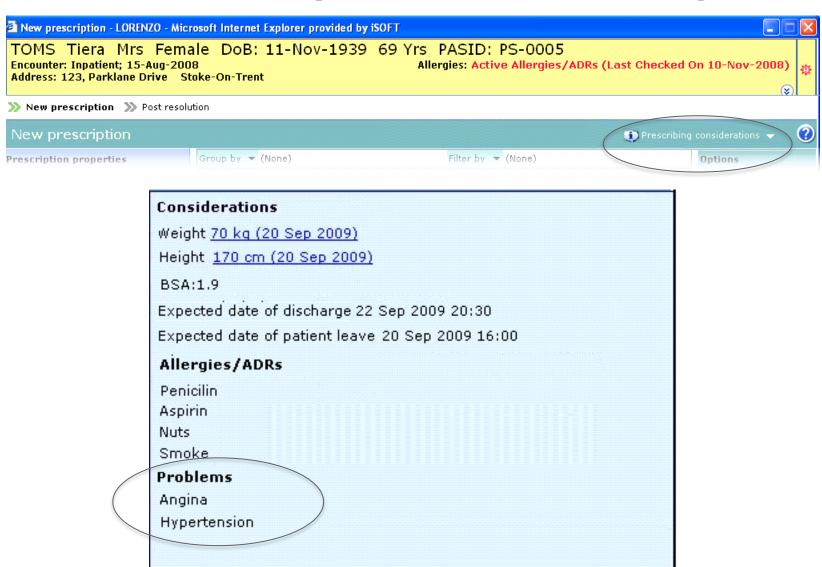

LORENZO Drug Contraindication Checking

- This is done in two ways
- Passive contraindication checking
 - User can choose to see the list of patient problems and make appropriate prescribing decisions
- Active contraindication checking
 - Performed upon selecting drug to prescribe
 - Alerts when drug is contraindicated for a patient condition (problem or procedure)
 - Also takes patient age and gender into account
 - Absolute/specific the relevance of the contraindication is very high to the drug item
 - Related the relevance of the contraindication is low, but chances do exist of potential harm to the patient

LORENZO Passive Drug Contraindication Checking

LORENZO Active Drug Contraindication Checking

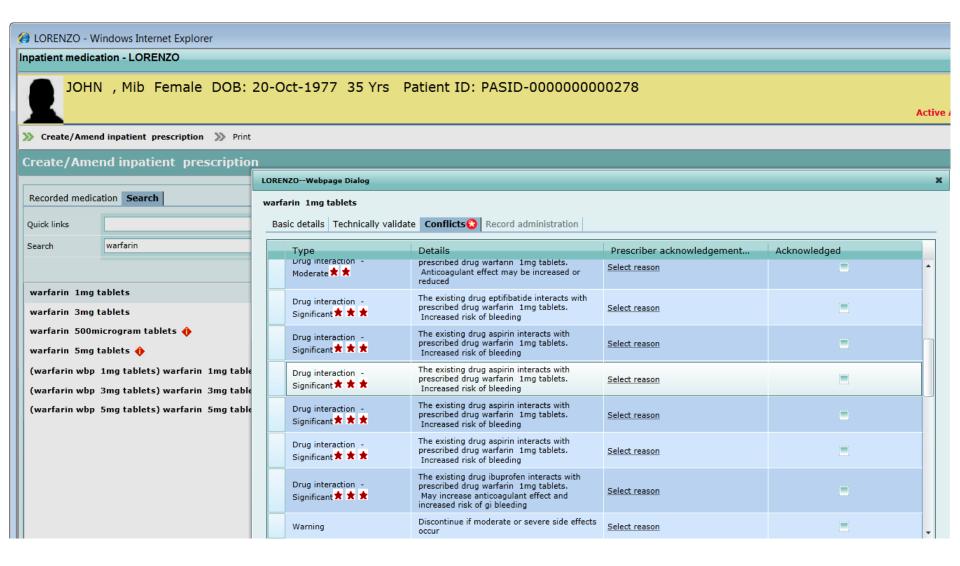

LORENZO Drug Interaction Checking

- The system checks if the drug being prescribed and a drug in the patient's current medication list belong to an interaction group pair
- Details on interaction group pairs are held in the prescribing catalogue
- These include the severity of the interaction which is denoted by the number of stars
 - High 4 stars
 - Significant 3 stars
 - Moderate 2 stars
 - Low 1 star

LORENZO Drug Interaction Checking

LORENZO Drug Duplication Checking

- The system checks of the drug being prescribed duplicates a drug in the patient's current medication list
- There are three types of duplicate checking
 - Doubling when both drugs are the same or share the same Virtual Product (this is a dm+d concept which equates to generic drug + form e.g. aspirin tablets)
 - Ingredient when both drugs share the same active ingredient
 - Hierarchy when both drugs belong to the same node within the drug node hierarchy (this is based on the SNOMED CT drug hierarchy)

LORENZO Drug Duplication Checking

Live Use

- The discharge prescribing capability has now been in live use for nearly two years
- Deployment started at the Royal Lancaster Infirmary (which is part of the University Hospitals of Morecambe Bay NHS Trust in England)
- The system is now in use in 6 wards at this hospital
- Over 40,000 discharge prescriptions were written in the past year

Decision Support Metrics

- A sample of approximately 15000 prescriptions was analysed
 - Multiple items per prescription
- Drug allergy alerts
 - Over 500 alerts
 - Nearly 400 of them acknowledged by clinicians
- Drug contraindication alerts
 - Over 24000 alerts
 - Over 7000 of them acknowledged by clinicians

Feedback

- Feedback has been very positive
- A number of other NHS hospitals have visited Lancaster to see this functionality in live use
- The system is being used by both clinical and pharmacy staff
- They are all looking forward to the forthcoming deployment of the inpatient prescribing and electronic medicines administration functionality

Summary

- Prescribing decision support has been proven to be beneficial
- A key benefit of SNOMED CT is the facilitation of decision support
- However there is very limited published literature about the implementation of decision support based on SNOMED CT
- CSC's LORENZO incorporates medication management functionality including prescribing decision support underpinned by SNOMED CT
- This functionality has now been in live use for nearly two years
