

reference set member version

A [reference set member](#) as created or modified at a particular point in time.

Notes

- A *reference set member version* is represented in [release files](#) as a single row with an [identifier](#), unique to that [reference set member](#).
- The [identifier](#) is shared by other versions of that *reference set member* as indicated by the *effectiveTime* and *active* fields.
 - The *effectiveTime* field indicates the point in time at which this version of the *reference set member* was created or superseded the previous version of the same *reference set member*.
 - The *active* field indicates if the *reference set member* is active or inactive.
